A Overview: what the administrator does

What the administrator does

- **People and access:** create people, choose the pages they may open, give Billing access.
- **Rates and fees:** rates by destination, automatic storage fee.
- **E-mail and invitations:** e-mails to customers, accounts on the website.
- **Imports:** customers and the Cargo history of the old system.
- **Monitoring:** activity log, e-mail history.
- **Setup:** Render, Supabase, e-mail ("Setup" page).

First time (checklist)

1. Change the administrator's default code (My account).
2. Create the people (Users & access) and the representatives.
3. Enter the rates by destination and the storage fee (Fees & rates).
4. Import the customers, then the Cargo history.
5. Connect e-mail (Render variables + redeploy admin-mail).
6. Make a test receipt and click "Notify by e-mail" to check.

B Sign in and the menu

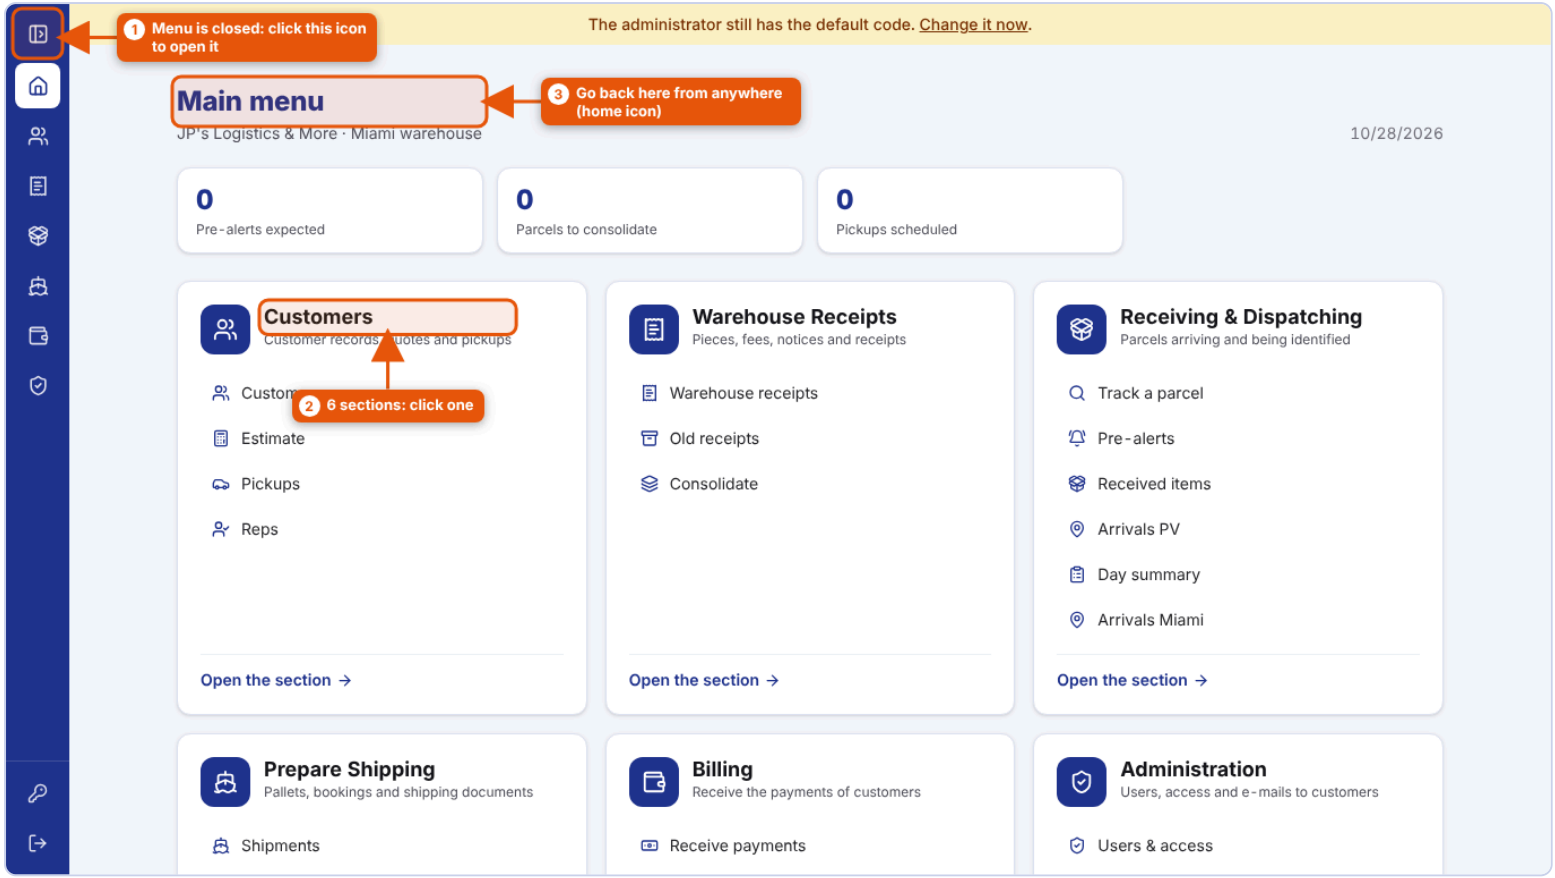

Why: Everyone signs in with a name and a code. The left menu starts closed.

The sign-in page. Enter your name and your code (you get them from the administrator), then click Sign in. If you enter the code wrong 5 times, the name is locked for 10 minutes.

1. Type your name
2. Type your code (password)
3. Click to sign in

Tip: Do not share your code. Change it in "My account" (Step B).

B Sign in and the menu

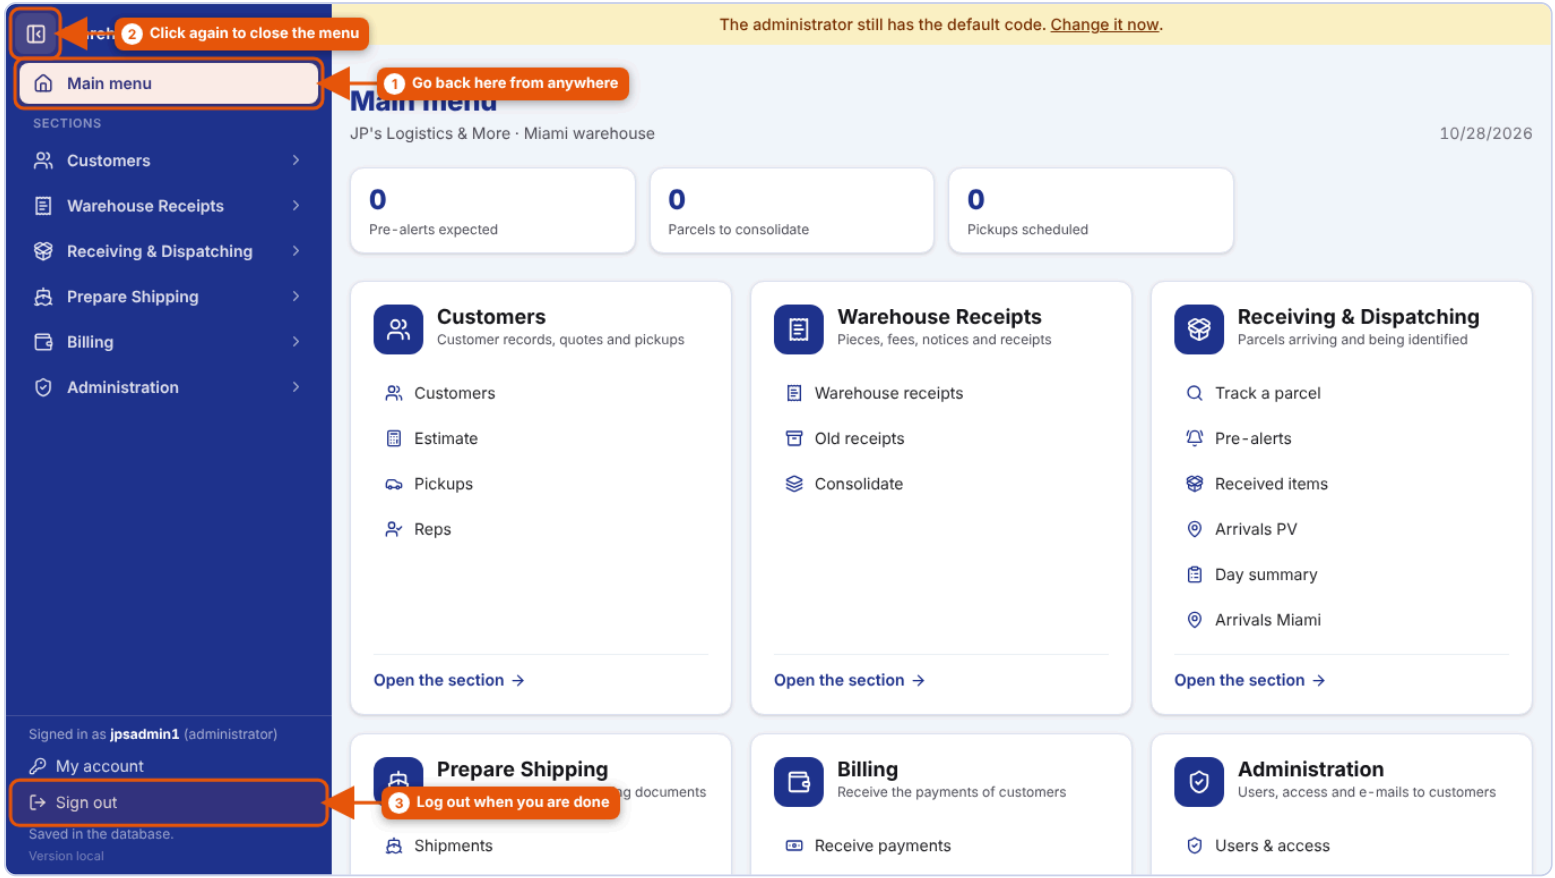

The Main menu. When the platform starts, the left menu is CLOSED: it stays closed until you open it with the small icon in the top-left corner. There are 6 sections: Customers, Warehouse Receipts, Receiving & Dispatching, Prepare Shipping, Billing and Administration. You only see the sections you are allowed to use. The numbers at the top show what is waiting.

1. Menu is closed: click this icon to open it
2. 6 sections: click one
3. Go back here from anywhere (home icon)

Tip: The closed menu is a thin column of icons: hover over an icon to see its name.

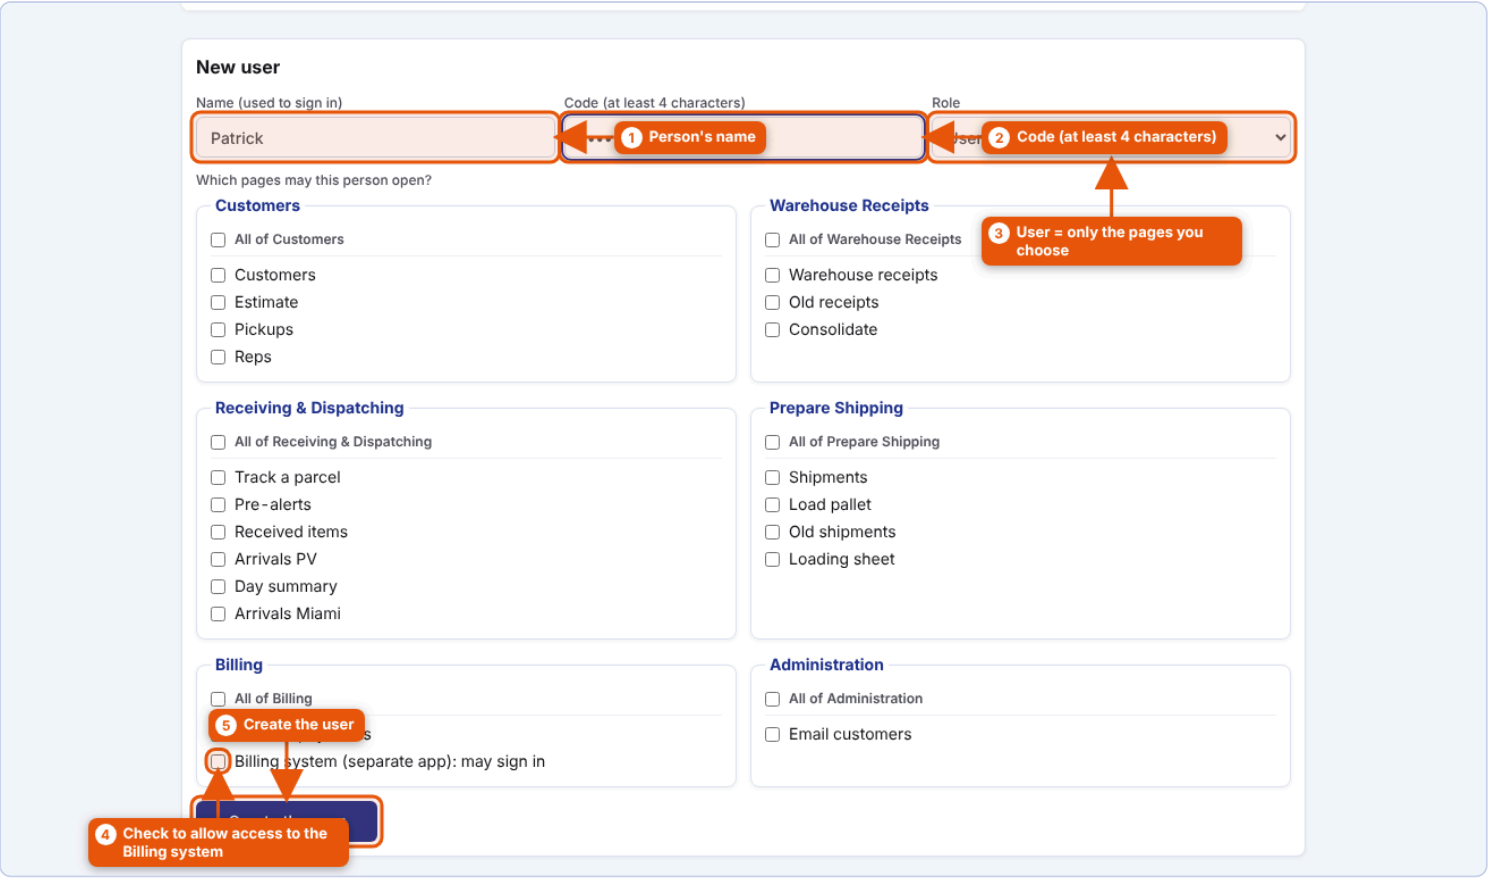

B Sign in and the menu

The menu open: all sections with their names. "Main menu" takes you back here from anywhere. Click the icon at the top again to close it. Your choice is remembered during the session.

1. Go back here from anywhere
2. Click again to close the menu
3. Log out when you are done

C People and access

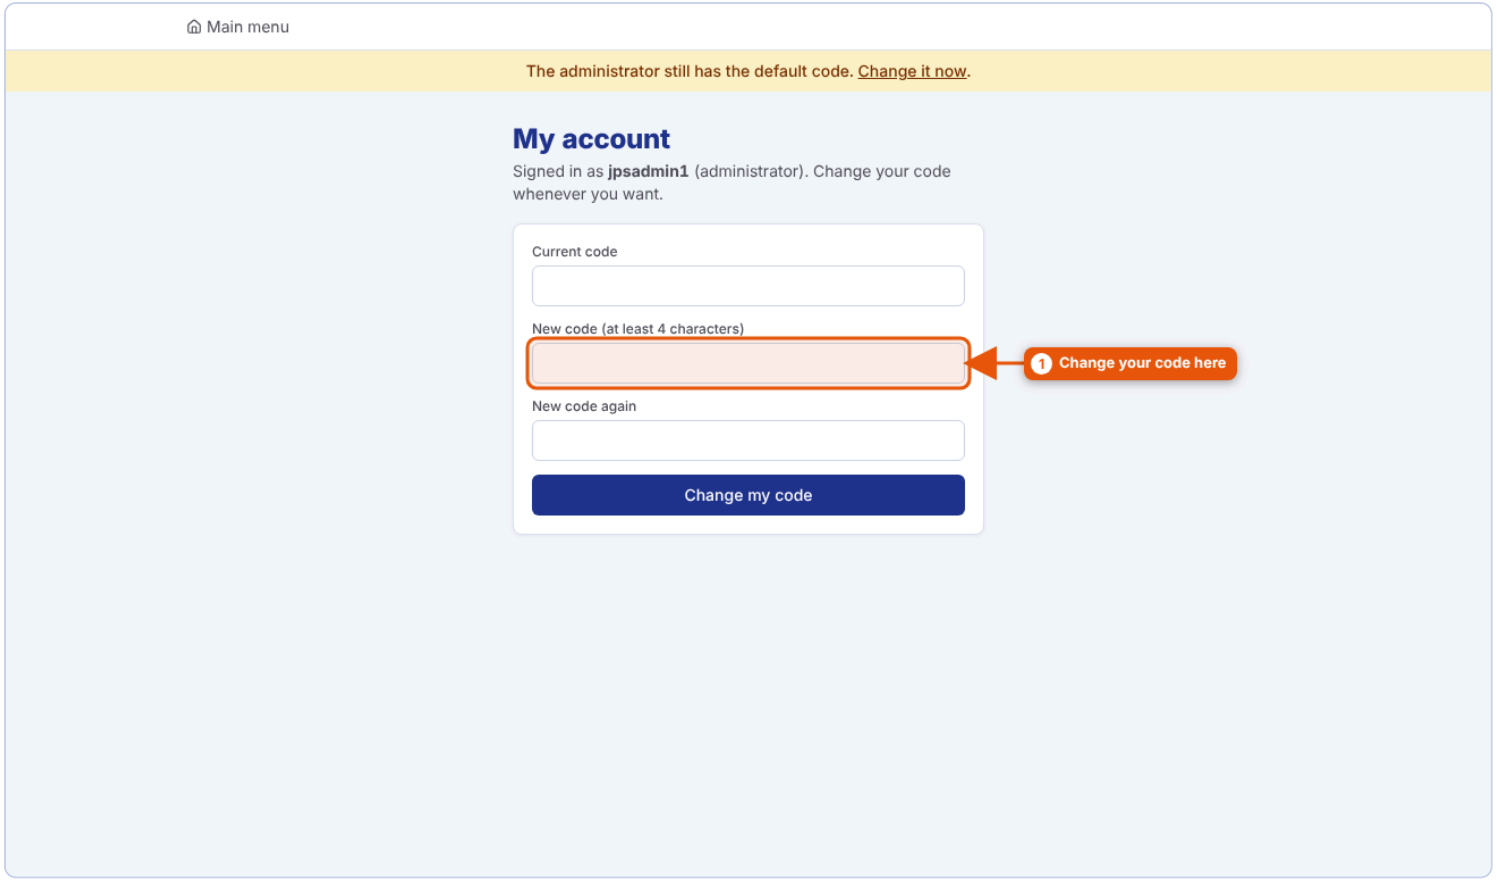

Why: The administrator creates each person and chooses which pages they may open. This is also where Billing access is given.

Administration → Users & access. Fill in the name, the code (at least 4 characters) and the role. "User" = only the pages you tick. "Administrator" = everything. Tick "Billing system (separate app): may sign in" so the person can sign in to the Billing system with the same name and code.

1. Person's name
2. Code (at least 4 characters)
3. User = only the pages you choose
4. Check to allow access to the Billing system
5. Create the user

Tip: Every action people take is saved in the Activity log (Step W).

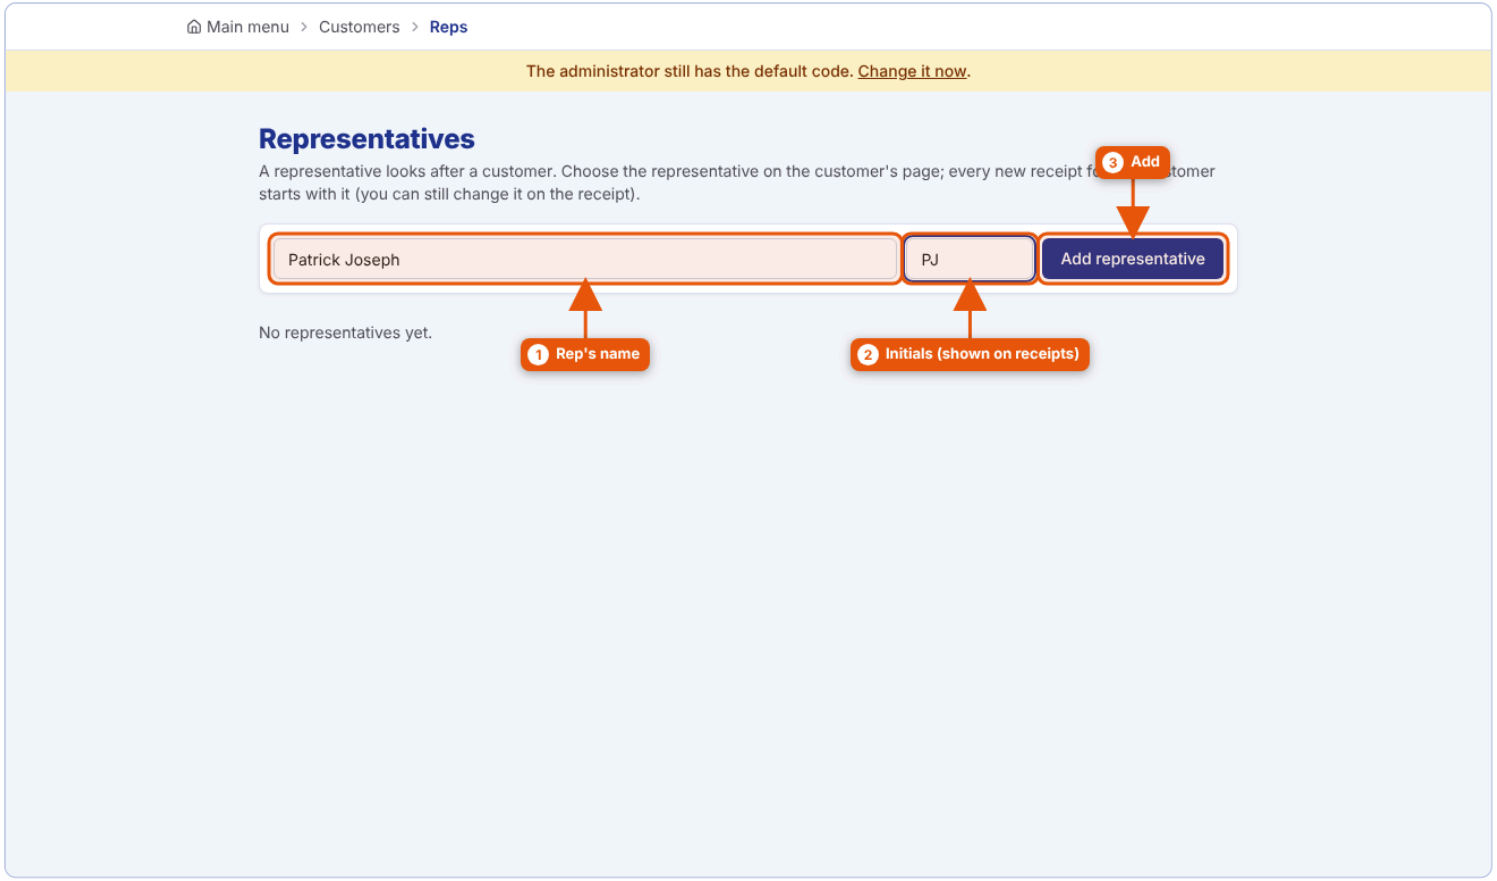

C People and access

My account: each person changes their own code here. The administrator should change the default code (jpsadmin1) immediately: a yellow reminder banner shows until it is done.

1. Change your code here

D Representatives (Reps)

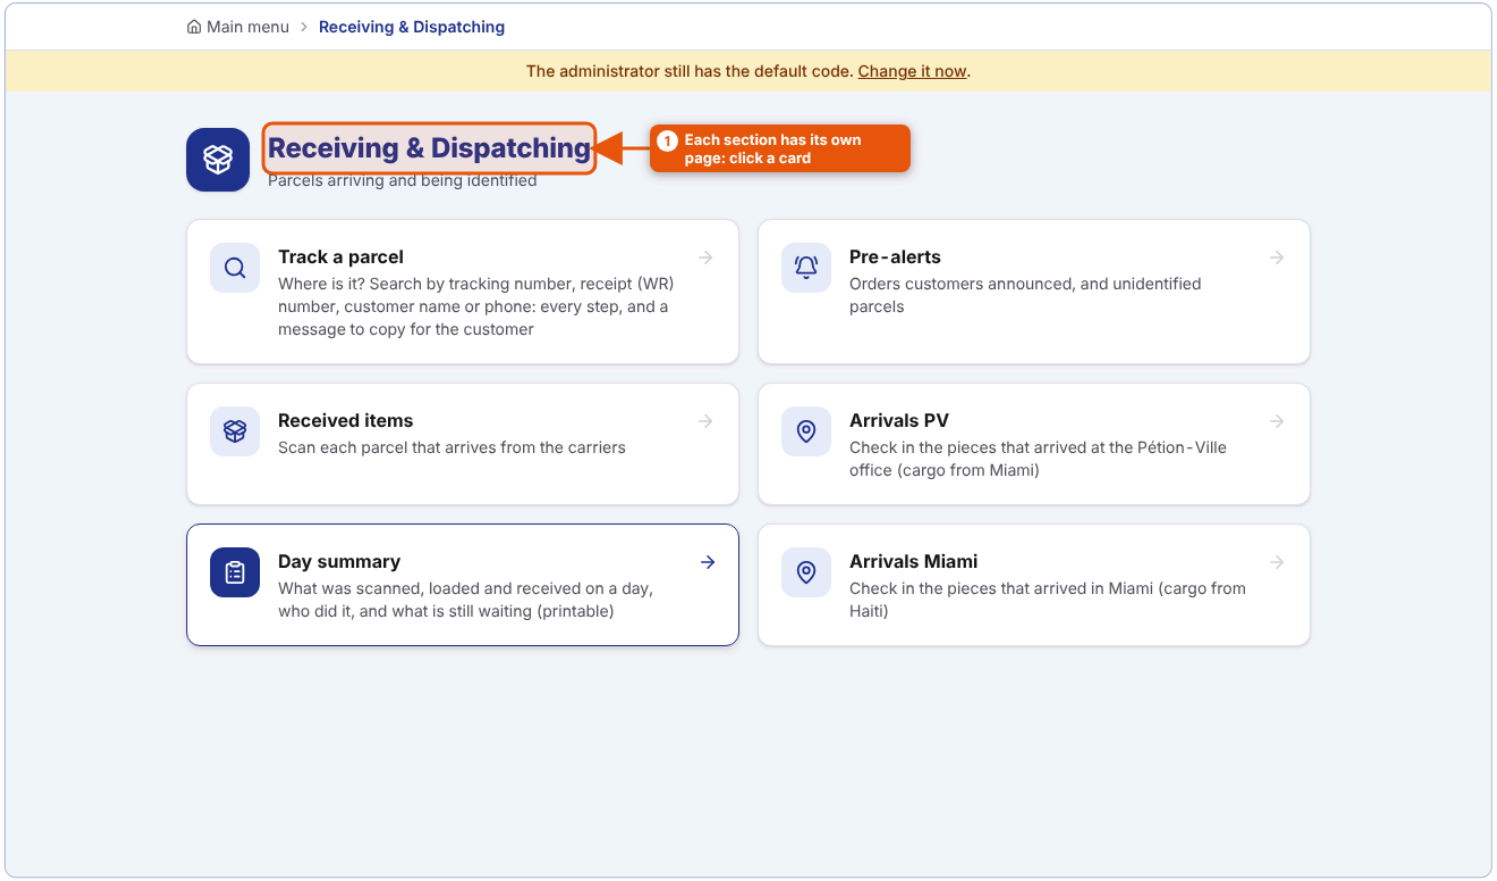

Why: A representative is the person in charge of a customer. Their initials appear on receipts and invoices.

Customers → Reps. Enter the name and initials, then click "Add representative". After that, you select the rep on the customer's record.

1. Rep's name
2. Initials (shown on receipts)
3. Add

E Section pages

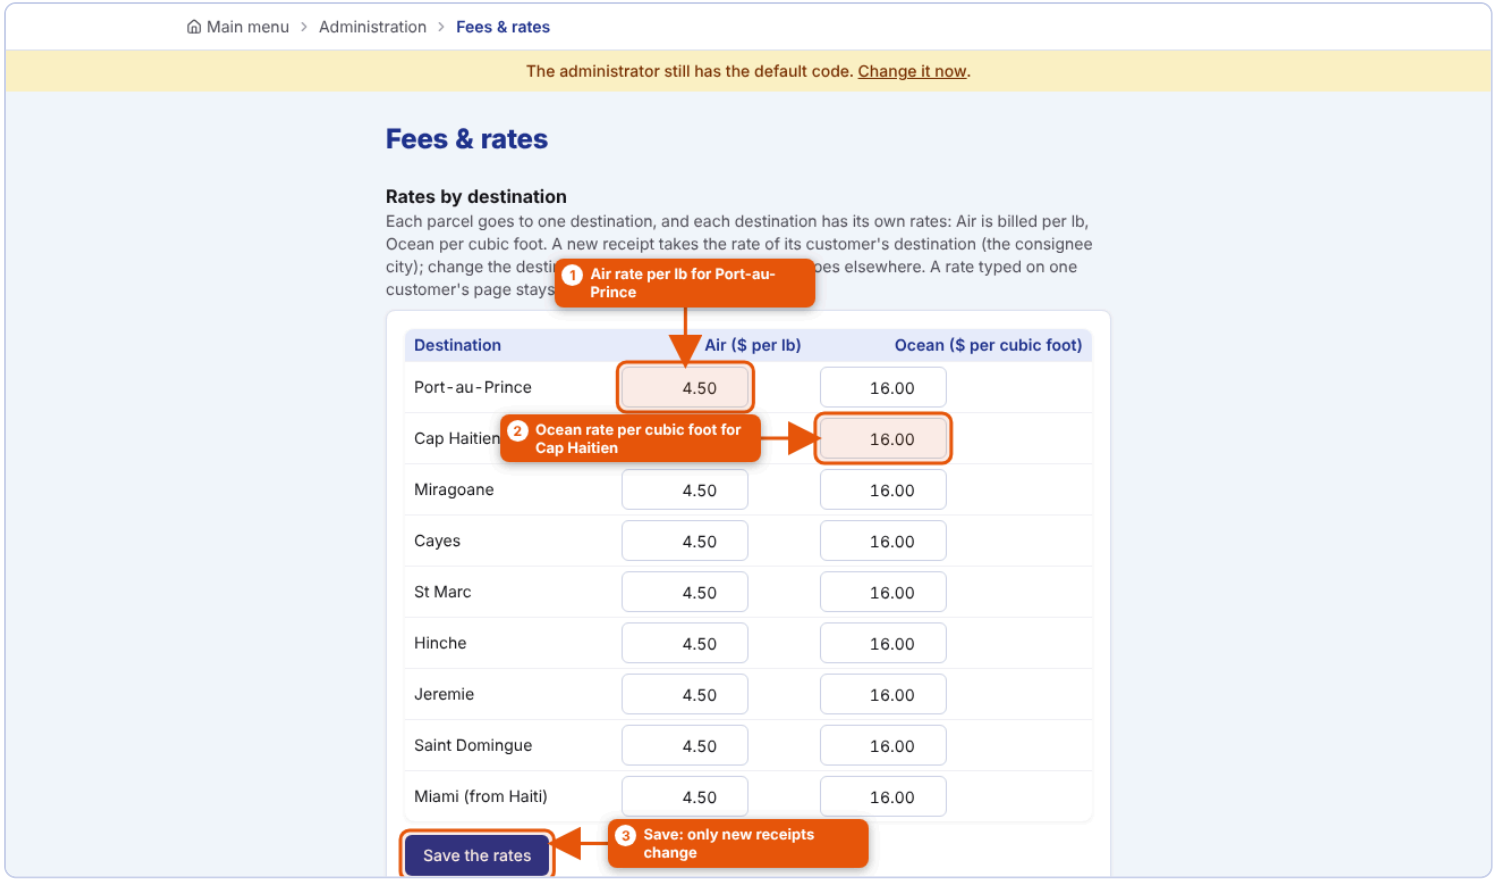

Why: Every section has a page with a card for each function.

Each section has a page with a card for each function.

1. Each section has its own page: click a card

F Rates by destination and storage fee

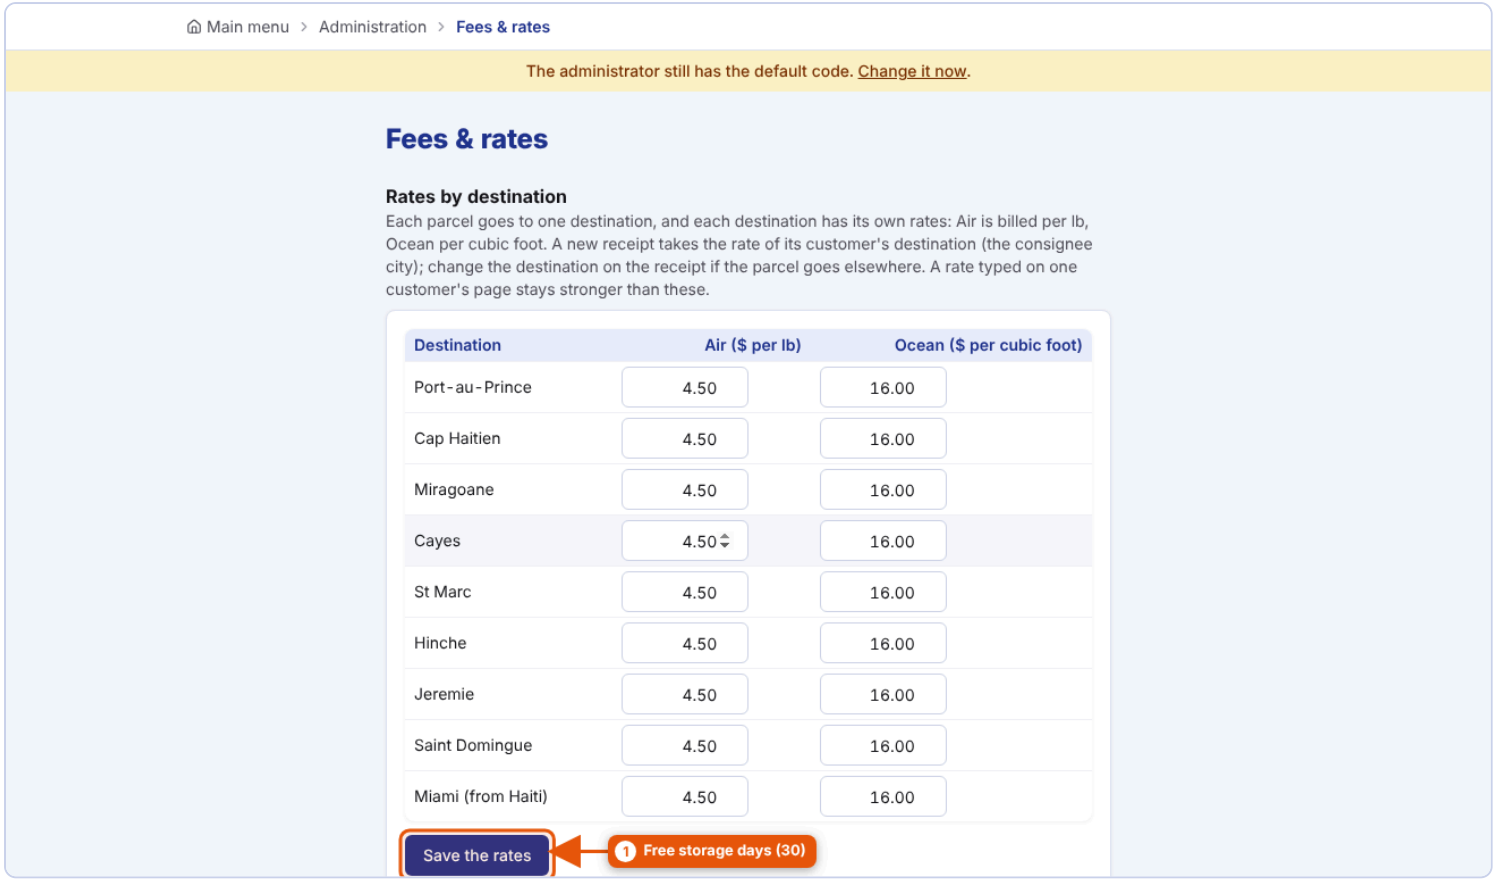

Why: This is where you edit each destination's rates and the automatic storage fee.

Administration → Fees & rates → "Rates by destination" (administrator only). One row per destination, with the Air rate (per lb) and the Ocean rate (per cubic foot). Click "Save the rates". They apply to new receipts and when a receipt changes destination or Air/Ocean; receipts already made keep their rate.

1. Air rate per lb for Port-au-Prince
2. Ocean rate per cubic foot for Cap Haitien
3. Save: only new receipts change

Tip: Enter your real rates: at the start every destination is $4.50 and $16. A new receipt takes its destination from the customer's consignee city.

F Rates by destination and storage fee

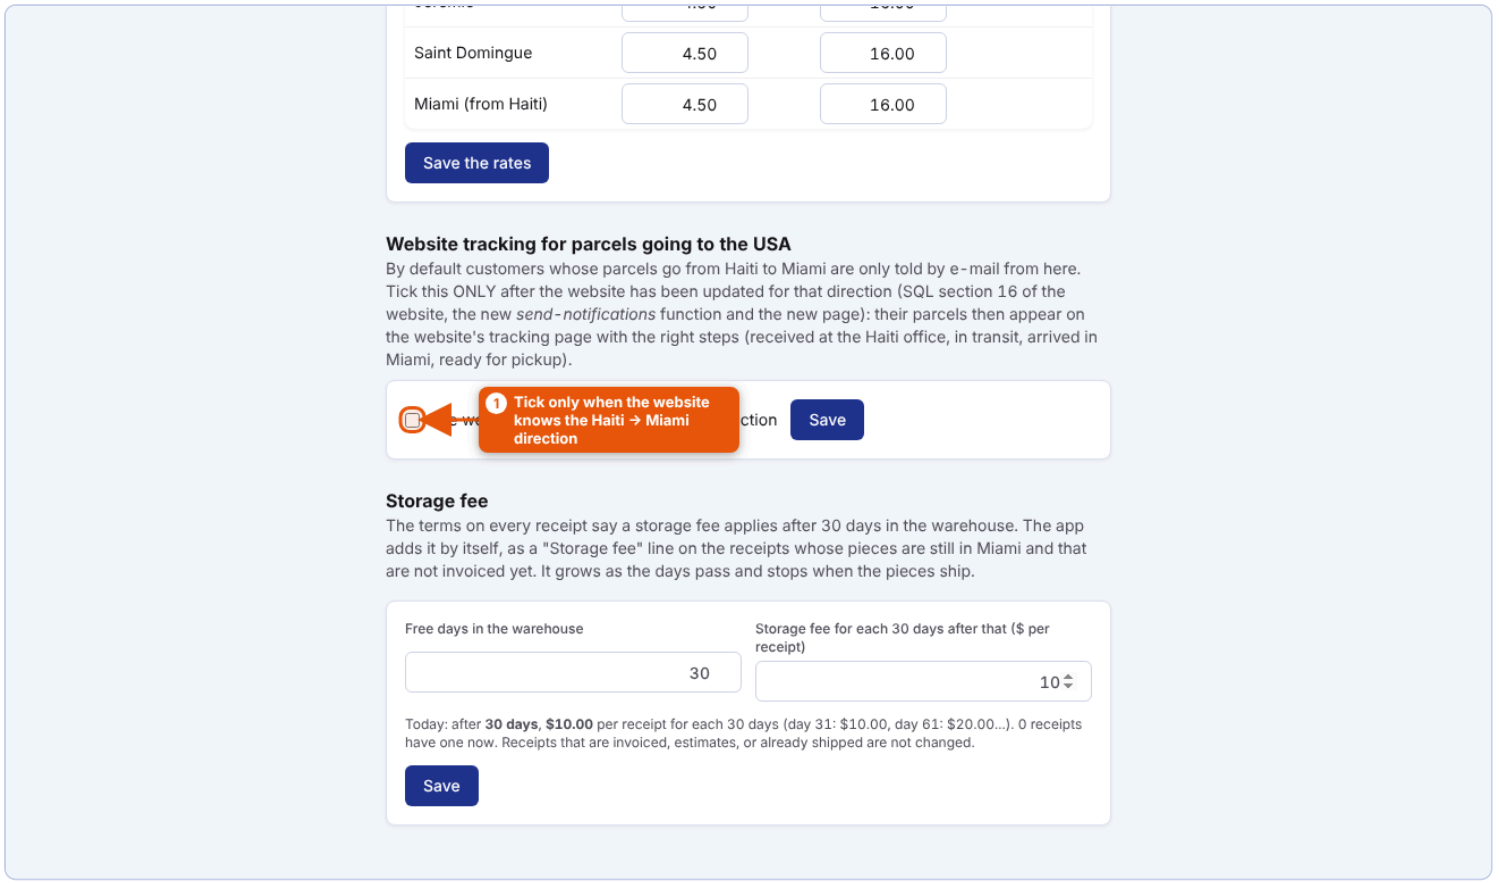

Administration → Fees & rates: AUTOMATIC storage fee. After the free days (30), the system adds a "Storage fee" line to receipts that are still in Miami and not yet invoiced, for every 30 days ($10 by default, you can change it). It grows with the days and stops when the pieces are loaded onto a shipment. Receipts that have an invoice or are estimates are not changed.

1. Free storage days (30)

> **Tip:** Set the fee to 0 to turn it off.

F Rates by destination and storage fee

Fees & rates → "The website knows the Haiti → Miami direction". Leave it unticked until the website is updated for this direction (SQL section 16 + the send-notifications function): until then, Haiti → Miami customers get e-mail only.

1. Tick only when the website knows the Haiti → Miami direction

G Rates by destination: how it works

Every parcel goes to a destination, and every destination has its own rates. The administrator edits them in **Administration → Fees & rates**.

The destinations

- Port-au-Prince · Cap Haitien · Miragoane · Cayes · St Marc · Hinche · Jeremie
- Saint Domingue
- **Miami**: parcels we take in Haiti to send to Miami

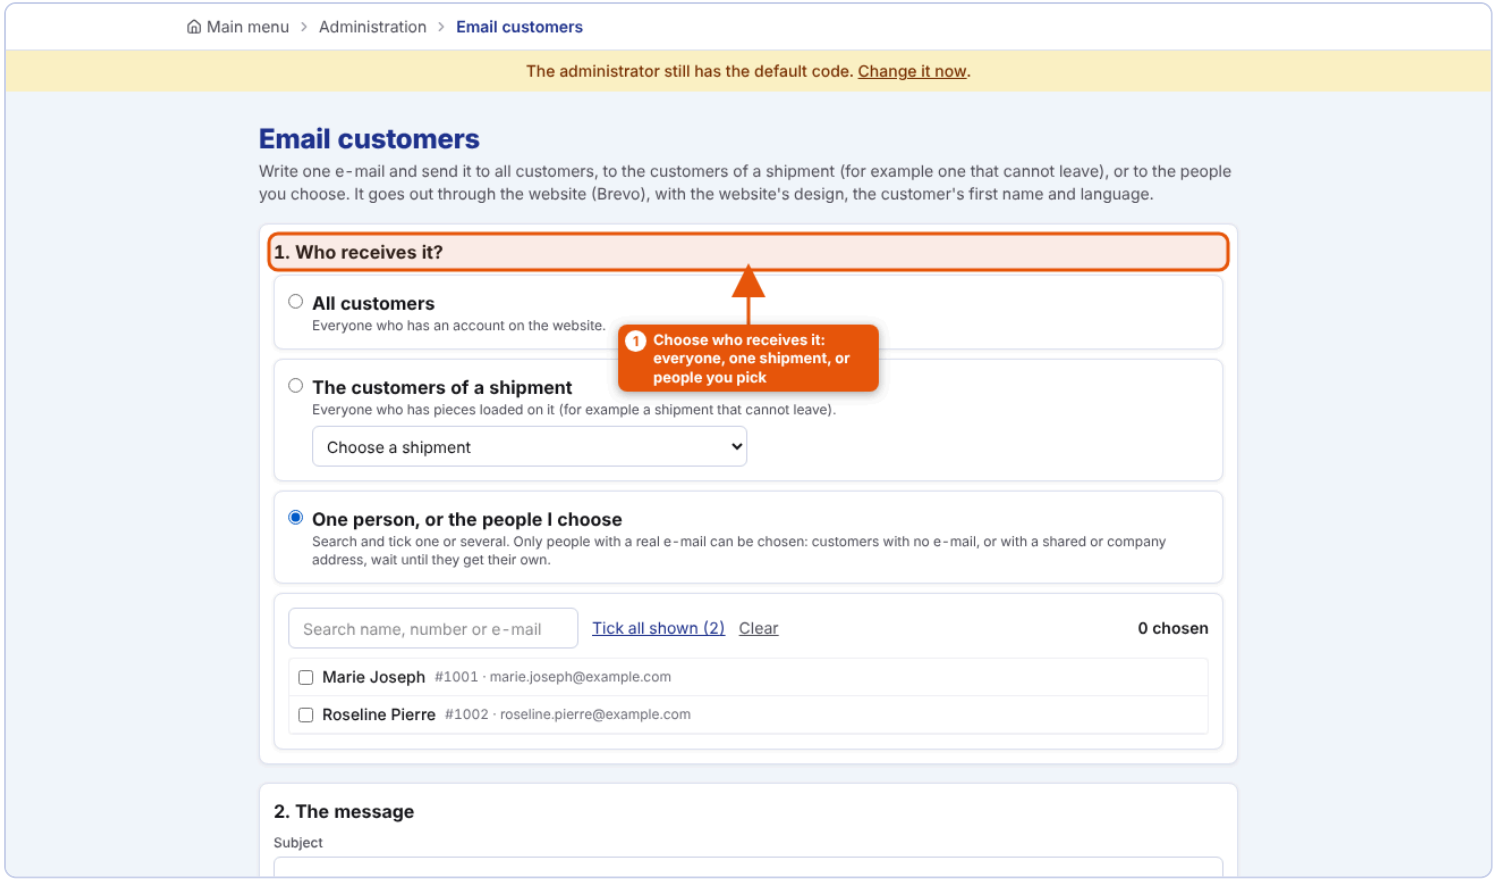

How the rate is chosen

1. A special rate of the **customer** (if their page has one) is always stronger.
2. Otherwise, the rate of the **receipt's destination** (Air per lb, Ocean per cubic foot).
3. Otherwise, the standard rate: $4.50 and $16.

A receipt's destination

- A new receipt takes its destination from the customer's **consignee city**. If the city is not recognised, it is Port-au-Prince.
- You can change it on the receipt (Receipt details → Destination) or on the estimate: the rate changes by itself.
- A receipt with an invoice cannot change destination (cancel the invoice first).
- Changing the rates in the admin page **does not change** receipts already made.
- The destination is printed on the PDF receipt ("To: ...").

H E-mail to customers

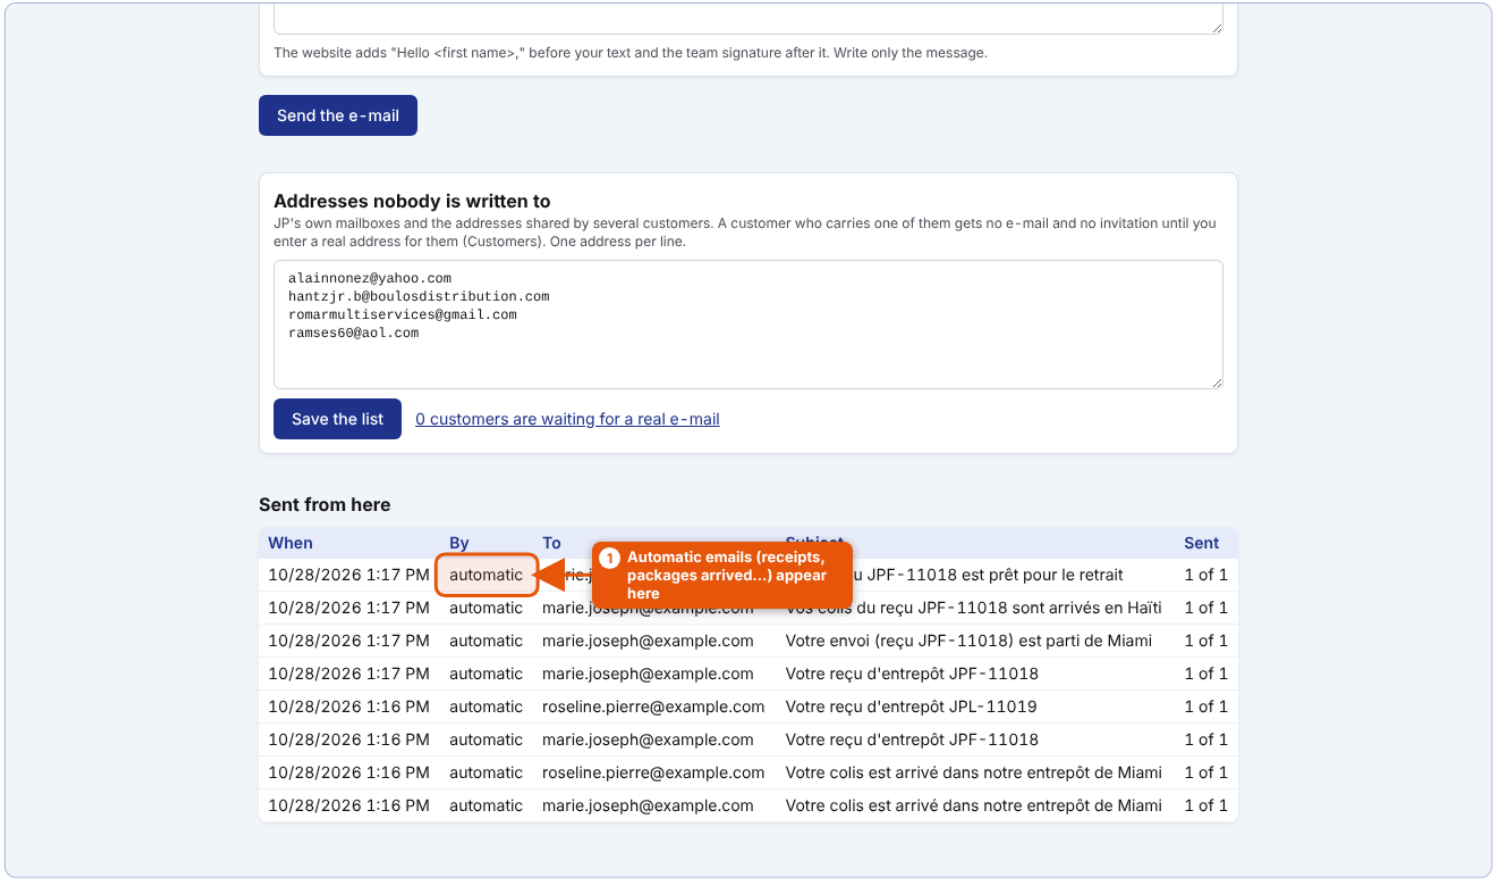

Why: Bulk e-mail and the history of the automatic e-mails.

Administration → Email customers: send an e-mail to all customers, the customers of a shipment (e.g. a shipment that cannot depart), or people you choose. It goes through the website (Brevo), with the customer's name and language. Customers with a shared or blocked e-mail do not receive it.

1. Choose who receives it: everyone, one shipment, or people you pick

Tip: This requires the website to be configured (SUPABASE_URL, SITE_STAFF_...). If it is not, the page tells you what is missing.

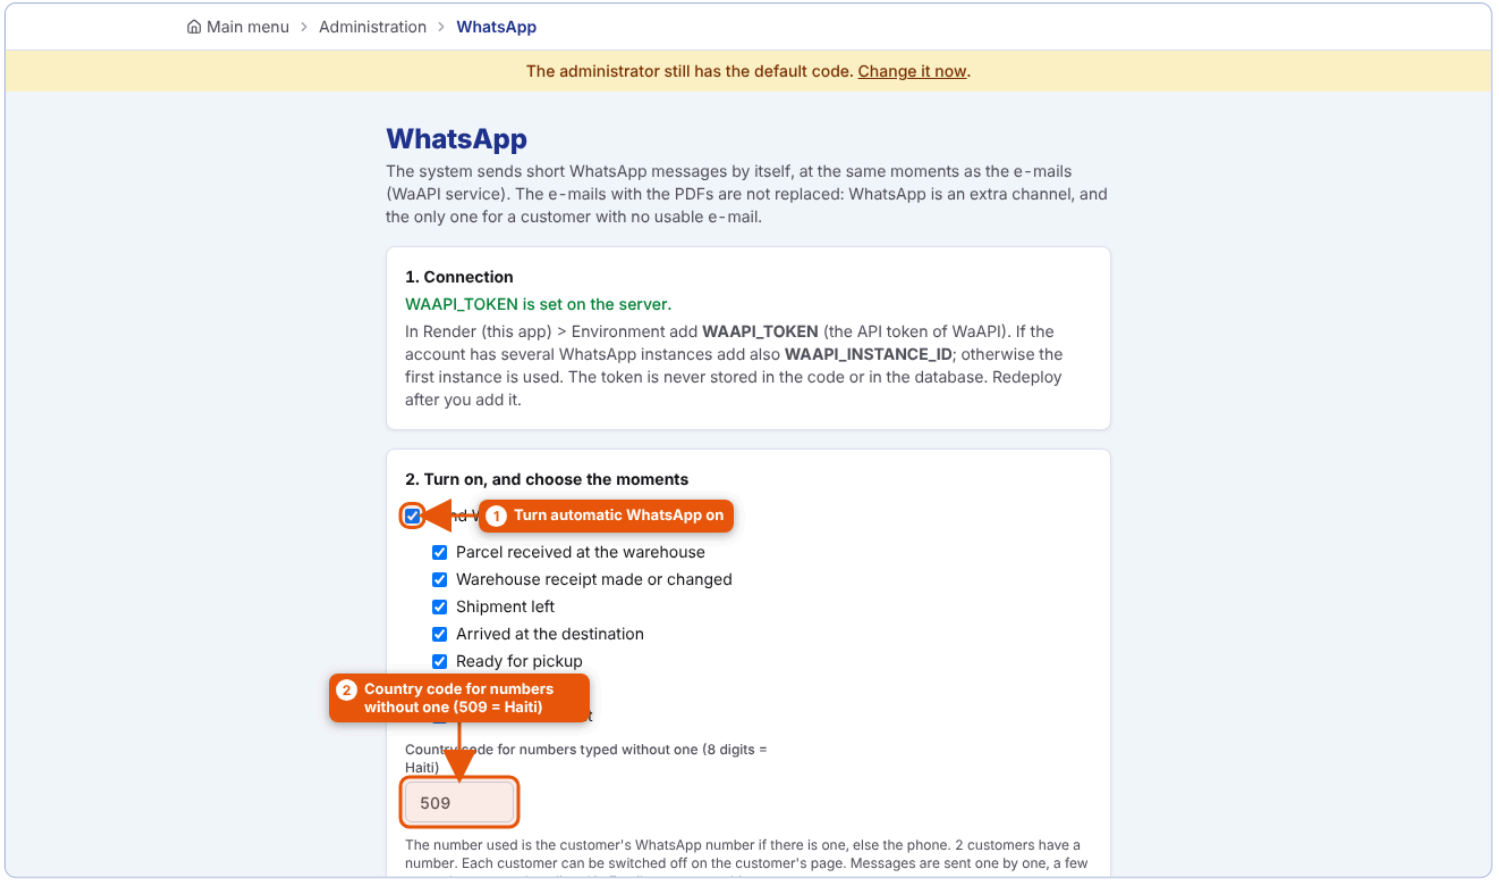

H E-mail to customers

Email customers → history: all automatic e-mails (PDF receipt, package arrived, your flight has departed...) appear there with the result. If an e-mail did not go out, you can see why.

1. Automatic emails (receipts, packages arrived...) appear here

I Automatic WhatsApp

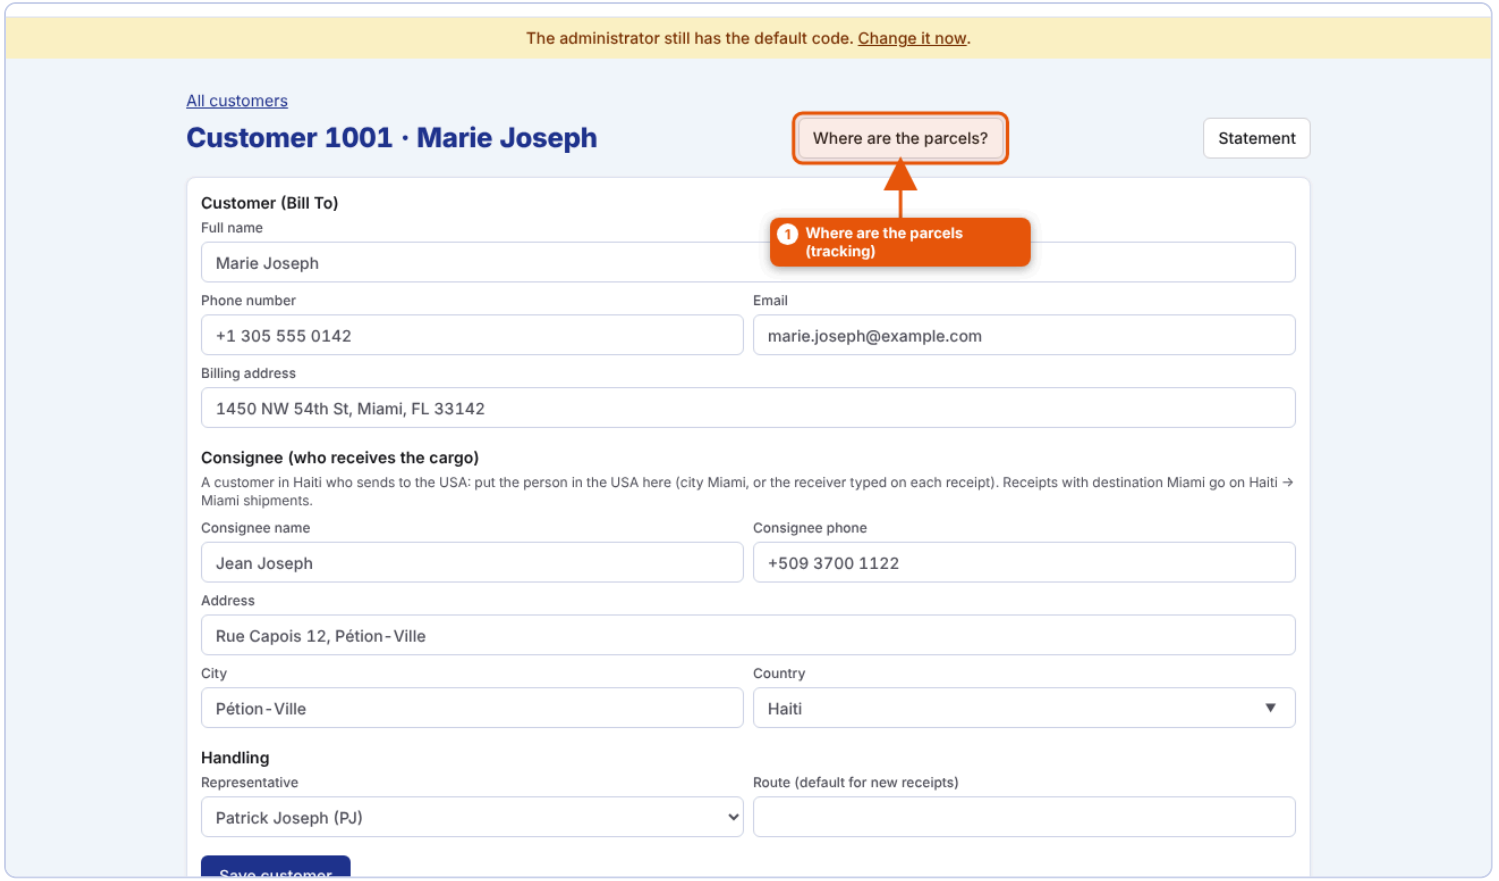

Why: WhatsApp messages go out with the e-mails, with the PDF.

Administration → WhatsApp (administrator only). Turn automatic WhatsApp on, choose the country code (509) and which events send a message (parcel received, receipt, in transit, arrived, ready, invoice, order). "Send a test" sends a test message to a number you choose.

1. Turn automatic WhatsApp on
2. Country code for numbers without one (509 = Haiti)

Tip: The WaAPI token is never written in the system: it lives in the "WAAPI_TOKEN" variable on Render (in both apps).

I Automatic WhatsApp

Customer record: "WhatsApp messages from the system: on/off" to stop the messages for a customer who does not want them. The "Where are the parcels?" link opens Track a parcel for this customer.

1. Where are the parcels (tracking)

WhatsApp: how it works and setup

The system can send **WhatsApp** messages to customers automatically (through the WaAPI service), together with the e-mails. The administrator turns it on in **Administration → WhatsApp**.

When a message goes out

- **Parcel received** (Received items): one message listing the tracking numbers.
- **Receipt ready**: receipt number, pieces, weight, Air/Ocean, estimated total + **the receipt as a PDF**.
- **In transit · Arrived · Ready for pickup**.
- **Invoice ready** (Billing) + **the invoice as a PDF**; **order** + PDF.
- The **Notify** button sends e-mail + WhatsApp together, at any time.

Which number is used

- The WhatsApp number on the customer's record, otherwise their phone. 8 digits = Haiti (509); 10 digits = USA (1).
- On the customer's record you can stop WhatsApp for one customer.

How the message is written

Hello Marie Joseph,

Your warehouse receipt JPF-11018 is ready.

• Number of pieces: 2
• Total weight: 143.27 lb
• Shipping: By air
• Estimated total: $754.72

The final price is confirmed on the invoice, after customs.
You will find the receipt attached as a PDF. It was also sent to you by e-mail.

This is an automated message.

JP's Logistics & More

- Every message is written line by line, in the customer's language (French, English, Spanish), and ends with "This is an automated message."
- If the PDF cannot go, the text goes anyway and the page says so.

K WhatsApp setup and troubleshooting

WhatsApp setup (one time)

1. Create an account on **waapi.app**, create an instance and connect the business WhatsApp number (scan the QR code).
2. On **Render**, in **both apps** (main and Billing), set the variable **WAAPI_TOKEN** = the WaAPI token. (With several instances: also **WAAPI_INSTANCE_ID**.) Redeploy.
3. Sign in as administrator → **Administration → WhatsApp**: tick "on", choose the events, and click "Send a test" with your number.

- **Never** paste the token in a chat, in code, in the database or on GitHub. If it appeared somewhere, change it on WaAPI.

If the message does not go

- Read the message of the "Notify" button: it says why ("WhatsApp NOT sent (...)").
- Check the instance is still connected on WaAPI (the number was not disconnected).
- The customer needs a valid WhatsApp or phone number, and WhatsApp must not be switched off for them.
- The history (Administration → Email customers) lists every "[WhatsApp] ..." message with its result.

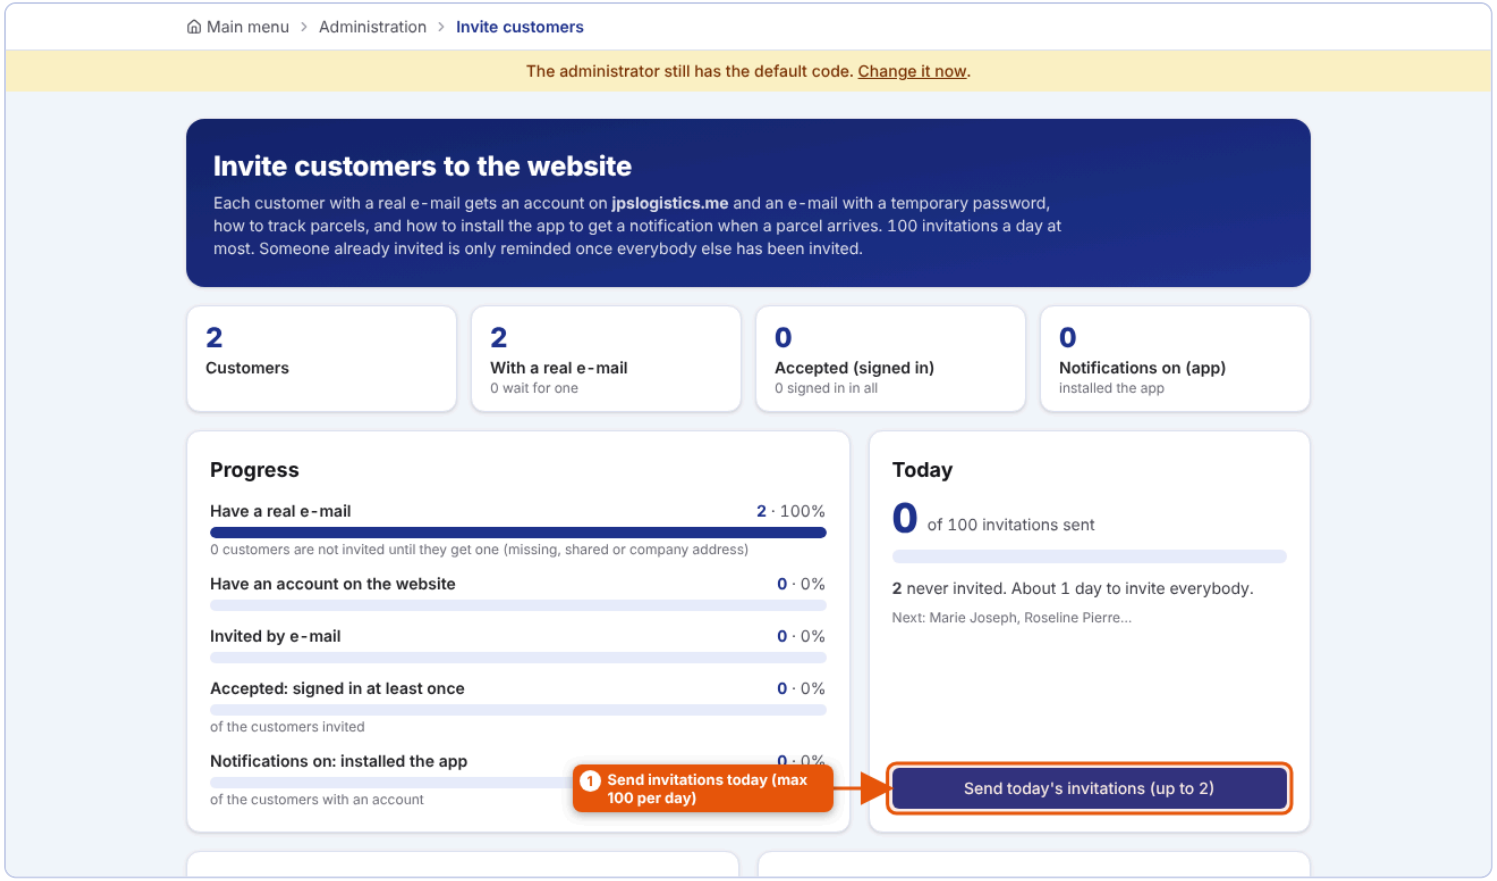

L Automatic e-mails: when, what, who

The e-mails and WhatsApp messages go out by themselves. To send one again (for example after you change the receipt), there is a single **Notify** button on the receipt, Arrivals, shipment, invoice and order: it sends e-mail + WhatsApp together. Customers with a website account get a push + e-mail; the others get the e-mail at the address on their record (if it is a real address, not a shared one).

When	What goes out	By whom
You finish scanning a list of parcels (Received items)	"Your parcel arrived at the Miami warehouse" (one message)	The website (push + e-mail) / the system + WhatsApp
A piece is saved (Consolidate) · the receipt changes	**The receipt as a PDF**, after ~2 minutes (several pieces = one e-mail) + WhatsApp with the PDF	The main system
You ship the cargo ("Ship this cargo")	"Your parcel is in transit"	The website / the system + WhatsApp
All the pieces of a receipt have arrived (Arrivals PV or Miami)	"Your parcel arrived"	The website / the system + WhatsApp
You mark "Ready for pickup"	"Your receipt is ready for pickup" with the office address	The website / the system + WhatsApp
You make an invoice (Billing system)	**The invoice as a PDF**, a few seconds later	The Billing system + WhatsApp with the PDF
You send an estimate (Estimate, website request)	Air + Ocean prices	The website ("E-mail this estimate" button)

- Every e-mail is written in the customer's language (French, English, Spanish) and logged in the history (Administration → Email customers). The PDF that was sent is kept: you find it on the receipt / invoice.
- An automatic e-mail is never sent twice for the same state; the Notify button forces it again.
- If an e-mail cannot go (no e-mail, shared address, network), the system notes why; for invoices it retries by itself.
- It needs the website connected (SUPABASE_URL, SITE_STAFF_EMAIL, SITE_STAFF_PASSWORD) and the admin-mail function up to date (redeploy it).

M Invite customers to the website

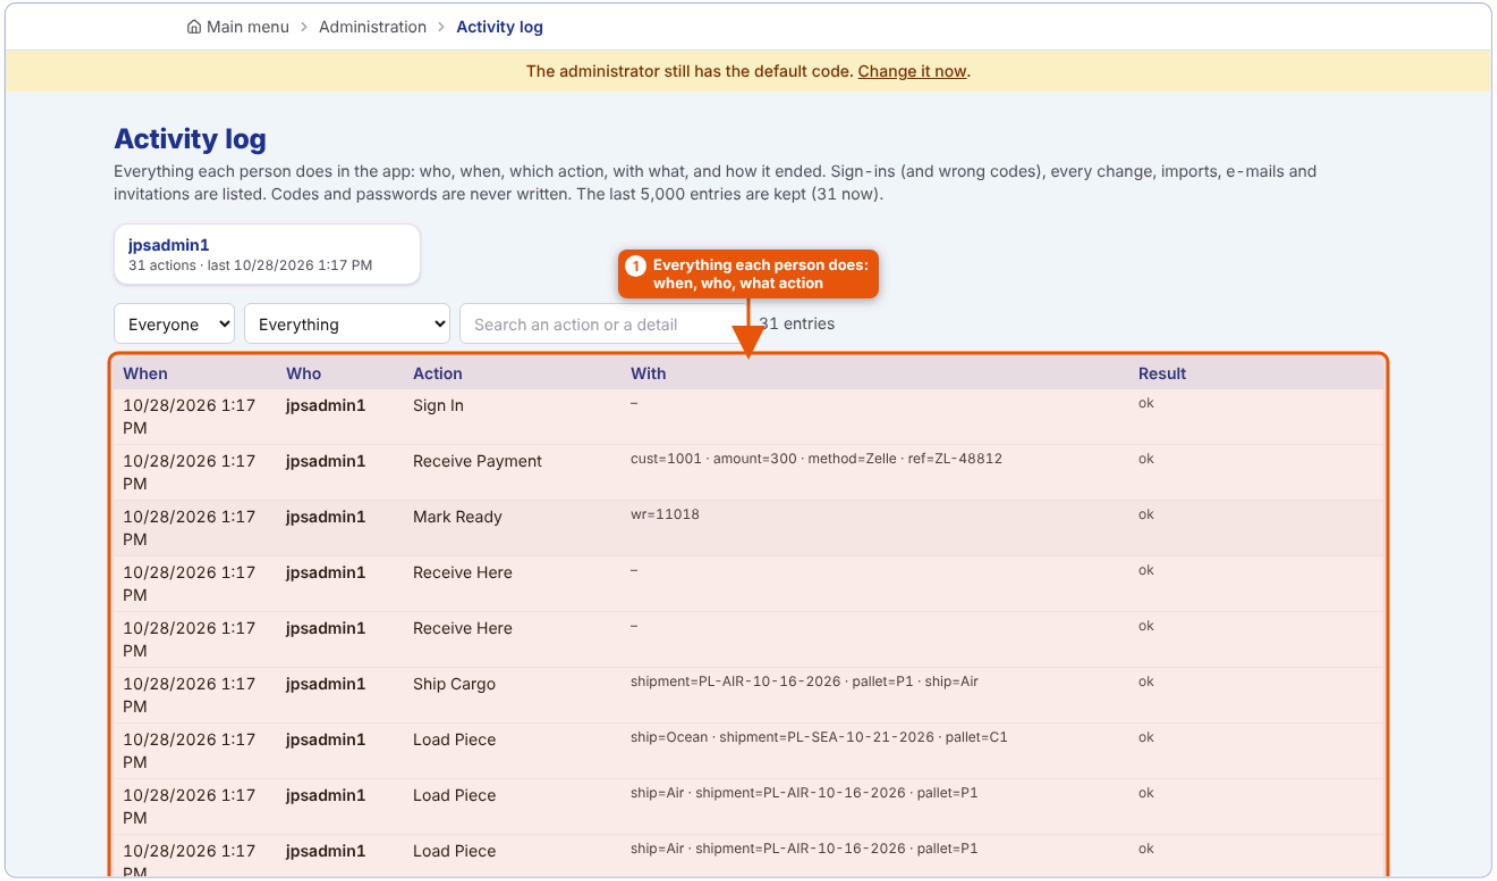

Why: Create customers' accounts on the website and send an e-mail with a temporary password.

Invite customers: create accounts on the website for customers who have a real e-mail, and send an e-mail with a temporary password (max 100 per day). Statistics: how many accepted (signed in at least once) and how many enabled push.

1. Send invitations today (max 100 per day)

N Activity log

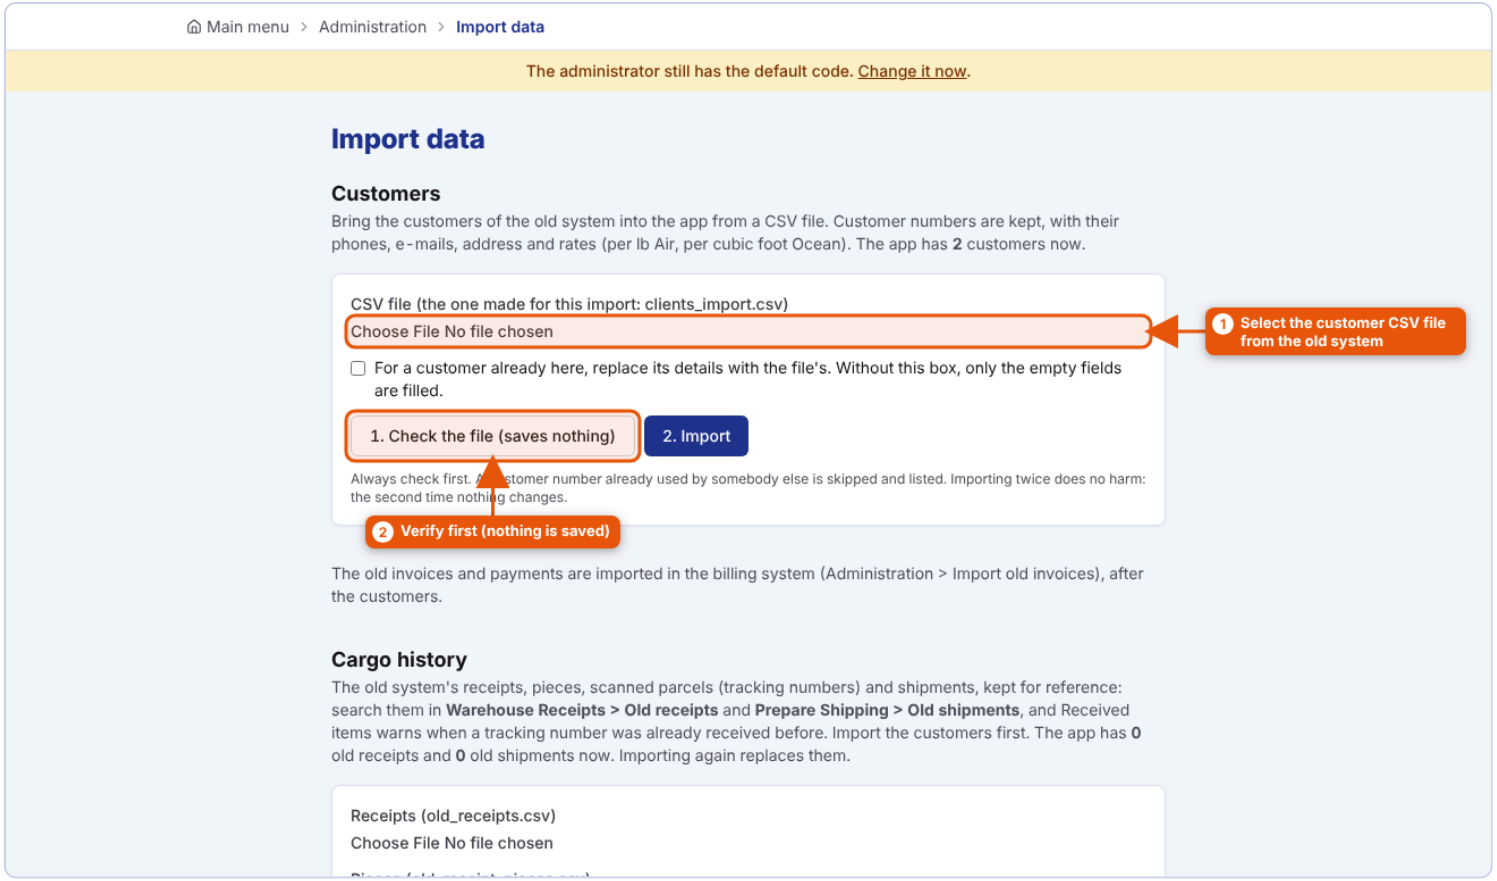

> **Why:** Everything each person does is written there.

Activity log: everything each person does (sign in, receive a payment, load a piece, ship a shipment…). Codes and passwords are never recorded there.

1. Everything each person does: when, who, what action

0 Import the old system's data

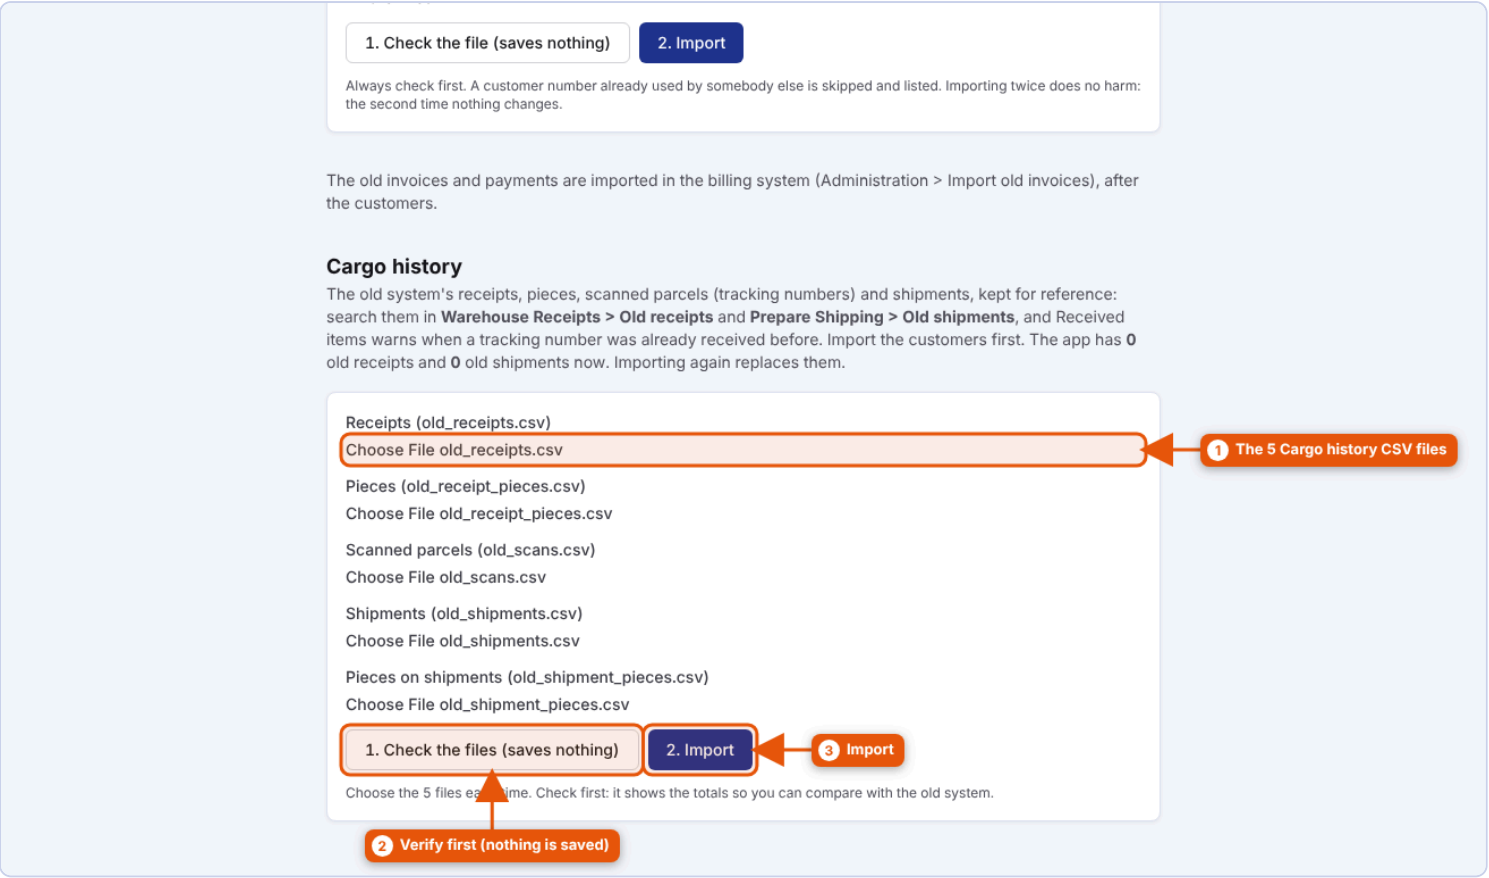

> **Why:** Import the customers first, then the Cargo history. Check before you import.

Import data: import customers from the old system in a CSV file (verify first; importing twice is safe).

1. Select the customer CSV file from the old system
2. Verify first (nothing is saved)

Import the old system's data

Old system Cargo history: 5 CSV files (receipts, pieces, scanned packages, shipments, pieces on shipments). Verify first; import the customers first. Importing a second time replaces the history.

1. The 5 Cargo history CSV files
2. Verify first (nothing is saved)
3. Import

Setup: Render, Supabase, e-mail

The sites and where they run

- **Main system** and **Billing system**: two applications on Render (Next.js), same database.
- **Customer website** (jpslogistics.me): Supabase. It talks to the systems through the **admin-mail** function (e-mail) and a webhook (status/push).

Render variables (main system)

- **DATABASE_URL**: the database. **AUTH_SECRET**: a long secret phrase.
- **SUPABASE_URL**, **SUPABASE_SERVICE_ROLE_KEY**: connection to the website.
- **SITE_STAFF_EMAIL**, **SITE_STAFF_PASSWORD**: the staff account that allows sending e-mail.
- Optional: **RECEIPT_MAIL_DELAY_SECONDS** (default 120: wait before the receipt goes), **APP_TIMEZONE**.

Render variables (Billing system)

- **DATABASE_URL** and **AUTH_SECRET**: EXACTLY the same values as the main system (so the same people and codes work).
- **WAREHOUSE_URL** (optional), and **SUPABASE_URL**, **SITE_STAFF_EMAIL**, **SITE_STAFF_PASSWORD** (same values) so invoices can go by e-mail.

The e-mail function (Supabase)

1. Supabase → **Edge Functions** → **admin-mail** → **Code** tab.
2. Paste the new code (file *supabase-functions/admin-mail/index.ts*) and click **Deploy updates**.
3. Do not touch Secrets (BREVO_API_KEY and the others are already there).
4. Test: on a receipt, click "Notify by e-mail": the e-mail must arrive with the PDF attached.

If the e-mail arrives without the PDF, the function has not been redeployed yet. SQL cannot do this: it is code, not database.

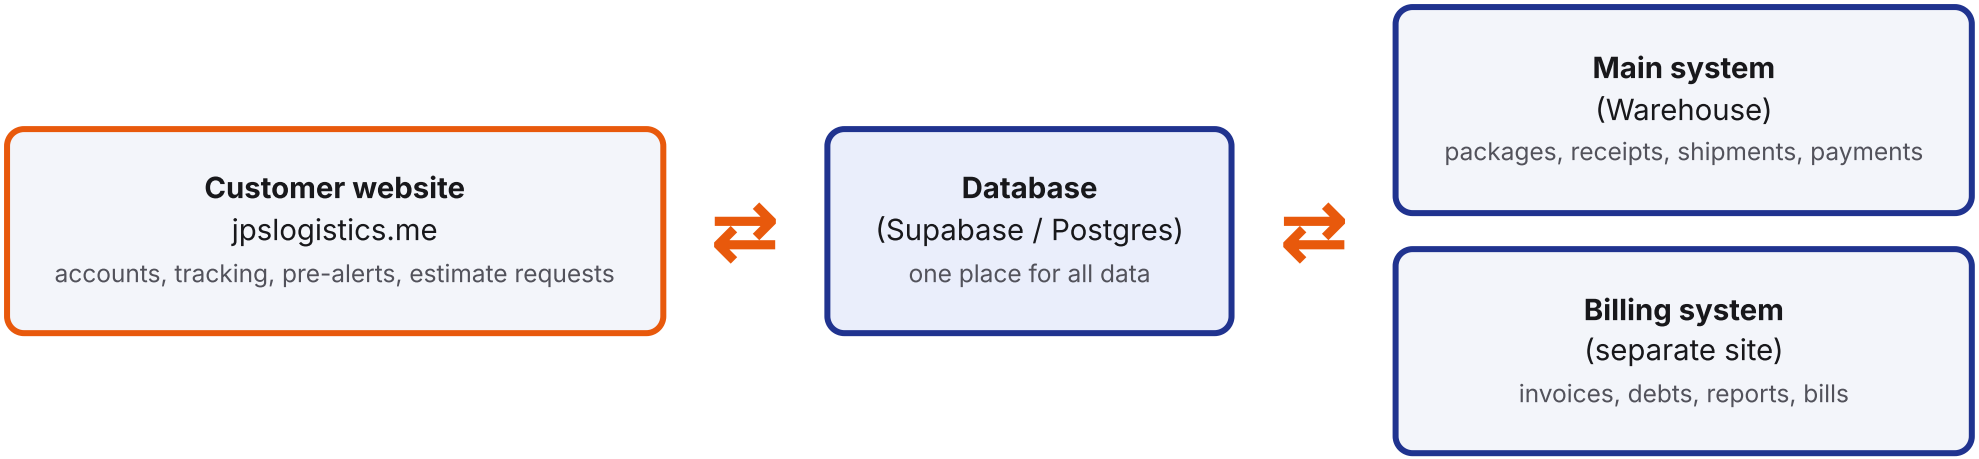

The database

- The tables create themselves the first time the application starts: you do not paste any SQL for the systems to work (receipts, invoices, expenses, saved PDFs...).
- The SQL you pasted for the website (sections 13, 14, 15) is for the customer website only.
- Make a backup of the database regularly in Supabase.

After every change

- Redeploy the main system and Billing on Render.
- If a system cannot reach the database, a red banner says "The database is not reachable": check DATABASE_URL.

How the platforms connect

- **Main system ↔ Billing system:** the same database. What one records appears in the other within a few seconds. The people and codes are the same; the administrator grants Billing access (Step B).
- **Main system → Customer website:** when you scan a package for a customer, when you ship a shipment, and when you scan in Arrivals PV, the website updates the status and sends a **push** (if the customer installed the app) and an **e-mail**.
- **Customer website → Main system:** customers' pre-alerts and estimate requests appear in Pre-alerts and Estimate. Accounts created on the website appear in Customers.
- **Installing as an app (PWA):** each site can be installed on a computer or phone (Step X).

Installing the app, the menu and the scanner

Install the systems as an app (PWA)

- **Computer (Chrome/Edge):** click "Install the app" under the left menu, or the install icon in the address bar.
- **Android (Chrome):** ⋮ menu → "Install app" / "Add to Home screen".
- **iPhone (Safari):** Share button → "Add to Home Screen".
- The app only saves static files; pages and data are never stored on the device. Without internet it shows "You are offline".
- Each system (main, Billing) installs separately.

The menu

- When the system starts, the left menu is **closed** (a thin column of icons). Click the icon at the top left to open it, again to close it.
- On a phone, the menu opens like a drawer.

Scanner and camera

- A USB scanner works like a keyboard: click the field and scan.
- The camera (camera icon) reads barcodes and QR codes; it picks up the tracking number by itself.

S Common problems and answers

- **E-mail did not go:** check Administration → Email customers (the history says why). Shared or blocked addresses do not receive.
- **E-mail goes without the PDF:** redeploy the admin-mail function (Setup page).
- **Someone forgot their code:** set a new one in Users & access.
- **Someone cannot see a page:** tick the page in Users & access.
- **Rates did not change on receipts already made:** normal; change the destination on the receipt (if there is no invoice).
- **"The database is not reachable":** check DATABASE_URL on Render.
- **The import is refused:** import the customers first; check the file with the "Check" button.
- **Help:** the Activity log shows who did what and when.
